

FBS Marshal™

COMPATIBILITY AGENT

FBS Marshal™ is a compatibility agent for direct addition to liquid fertilizers. FBS Marshal has been designed for formulators to easily use in problematic blends. It improves compatibility and stability of most fertilizer tank mixes.

TECHNICAL INFORMATION

FBS Marshal provides several known benefits:

- Minimizes precipitation when mixed with phosphate fertilizers by complexing with calcium, iron, zinc, manganese, copper and other positively charged ions.
- Reduces potential plugging or scaling in irrigation systems by forming complexes with calcium, iron and aluminum in ground and surface waters.
- Disrupts the formation of calcium-phosphate crystals, resulting in fewer and much smaller crystals that might potentially clog screens, spray nozzles, application equipment or irrigation systems during fertilizer applications.

RATES

Standard rate is 2% of the total tank mix. However, ranges may vary from 0.5%-10% rates of the total tank mix. A jar test is recommended to determine the specific rate determination.

See product label for complete Directions For Use.
